How these numbers are calculated

Invitation	One invitation record — a family unit addressed to its primary guest.
Invited pax	Sum of allocated pax across all invitations.
Confirmed pax	Sum of confirmed pax on invitations whose latest RSVP is attending. Changed answers replace earlier ones.
Declined pax	Allocated pax of declined invitations, plus the seats attending parties left unclaimed (allocated minus confirmed). Invited = confirmed + declined + awaiting.
Guest groups	VIP and VVIP guests; family by the side recorded on the invitation; friends; business; everyone else as Other. Each invitation counts in one group.
Actual attendance	Pax checked in at the door by the WO team, excluding undone check-ins. Parties arriving in several groups are summed once.
Attendance vs RSVP	Actual attendance ÷ confirmed pax × 100.
Attendance vs invite	Actual attendance ÷ invited pax × 100.
No-show rate	(Confirmed pax − actual attendance) ÷ confirmed pax × 100. Guests arriving beyond their confirmation offset no-shows; both are listed separately.
Table utilization	Seated pax ÷ table capacity. Tables below 80% of capacity are marked underutilized.
